

Bronchitis

Bronchitis is swelling of the lining of the airways called bronchioles in the lungs. The swelling causes more mucus than normal to be made. This can block the airflow through the lungs and may damage the lungs.

Acute bronchitis lasts 2-4 weeks and can be treated.

Chronic bronchitis is a long-term disease of the lungs. It is one disease in a group of lung diseases called COPD or chronic obstructive pulmonary disease. The damage often gets worse over time and cannot be cured.

Signs of Bronchitis

- A frequent cough
- Feeling tired
- Chest pain with coughing or deep breathing

- Noisy breathing
- Shortness of breath
- Body aches
- Fever or chills
- Sore throat
- Runny or stuffy nose

Causes of Bronchitis

- Bacterial or viral infections
- Smoking
- Air pollution
- Allergy to something in the air such as pollen
- Lung disease such as asthma or emphysema

Your Care

Your care may include medicines and breathing exercises to help you breathe easier. You may need oxygen if you have chronic bronchitis. Your care may also include:

- Avoiding colds and the flu.
- Drinking a lot of liquids to keep mucus thin.
- Using a humidifier or vaporizer.
- Using postural drainage and percussion to loosen mucus from your lungs. You will be taught how to do this.

To Breathe Easier

- Quit smoking. The only way to slow the damage of chronic bronchitis is to quit smoking. It is never too late to quit.
- Do not drink alcohol. It dulls the urge to cough and sneeze to clear your air passages. It also causes your body to lose fluid, making the mucus in your lungs thicker and harder to cough up.
- Avoid things that irritate your lungs such as air pollution, dusts and gases.
- Sleep with your upper body raised. Use foam wedges or raise the head of your bed.

Call your doctor **right away** if you:

- Have chills or a fever over 101 degrees F or 38 degrees C
- Need to use your inhalers or breathing treatments more often

- Have more mucus, the color changes, or it becomes too hard to cough up
- Have a new or worsening gray or blue tint of your nails or the skin of your fingers or mouth
- Have trouble talking or doing your normal activities
- Have to use more pillows when sleeping or start having to sleep in a chair to breathe at night

Call 911 **right away** if you:

- Cannot get your breath
- Become confused, dizzy or feel faint
- Have new chest pain or tightness

Talk to your doctor or nurse if you have any questions or concerns.
